

localAi (Private AI Infrastructure for Business):

Problem Statement:

Most businesses have multi-modal data (images, texts, audio, spreadsheets, and emails), and all of them are scattered around and underutilized. Though the use of AI promises to be a powerful mediator, companies fear feeding data to LLMs due to privacy policy, compliance requirements, and fear of data leakage. The result is that most companies are not benefiting AI at all – not because they do not want to, but because the available options feel unsafe and complex to implement.

Our Solution:

localAi installs a private AI server in the client's premises, with an open-sources LLM and builds an intelligent layer on top of it using:

- a) **RAG:** Allows AI to search and reason over the company's document and data.
- b) **MCP:** Connects the AI to the company's existing tools, databases, and file systems.
- c) **A simple chat interface:** Staff can ask questions, request reports, generate summaries, or produce visualizations

Critically, all the data stays on the client's own hardware, and no data is sent to OpenAI, Anthropic, Google or external sources.

As clients grow with us, we progressively build more layers: automated dashboards, presentation generations, and eventually videos output.

Informal Section: How can we generate revenue?

- a) Set-up fee: Flat set up fee
- b) Monthly retainer: Provide services like updating the models, more features
- c) Custom work: Extending features
