Mid-Year Addendum to the Product & Policy Handbook Effective July 1, 2026

This addendum updates select sections of the January 2026 Product & Policy Handbook (v1.0). Where a figure or policy here conflicts with the January handbook, this document is authoritative as of the effective date above. Sections not mentioned here remain governed by v1.0.

1. Pricing Updates

Effective July 1, 2026, the following pricing changes apply. The RX-2000i has been discontinued and replaced by the RX-2000x; existing RX-2000i service contracts remain valid through their original term.

Model	Jan 2026 Price	Jul 2026 Price	Status
RX-20	\$49	\$49	Unchanged
RX-200	\$299	\$279	Price reduced
RX-2000	\$12,499	\$12,499	Unchanged
RX-2000i	\$13,999	—	Discontinued
RX-2000x (new)	—	\$14,999	New model, replaces RX-2000i

2. Warranty Policy Revision

The temperature-based void condition described in Section 2 of the January handbook has been revised. Field data showed the original industrial-unit range was too permissive for high-humidity installations. Effective July 1, 2026, the warranty is void if an industrial unit (RX-2000 series) has been operated outside of the ambient range of

–10°C to 45°C (revised down from the previous 55°C ceiling), measured at the base of the controller enclosure rather than ambient room temperature as before. Consumer-unit terms are unchanged from the January handbook. All other warranty conditions (24-month base period, Acme Care+ eligibility, exclusion of consumables) remain unchanged.

3. Return Policy Update — Europe Only

Following a regulatory review, the European return window has been extended. Effective July 1, 2026, customers in the EU/EEA/UK may return any unopened product within 30 calendar days of delivery (extended from 14 days). The no-restocking-fee term for opened returns is unchanged. North America and Asia-Pacific return policies are unaffected by this addendum and remain as stated in the January handbook.

4. New Initiative: Project Falcon (Logistics)

Note for internal readers: “Project Falcon” is being reused this year as the codename for an unrelated initiative — the warehouse logistics software rollout described below — and should not be confused with the RX-2000i controller platform referenced under the same name in the January 2026 handbook. The two are unrelated programs that happened to share an internal codename.

The logistics Project Falcon is a new inventory-routing system being piloted at the Rotterdam facility starting Q3 2026, intended to reduce pick-to-ship time for RX-200 consumer units by an estimated 18%. A full rollout to the Singapore facility is tentatively planned for Q1 2027 pending pilot results.

5. Quarterly Revenue Snapshot

Figures below are preliminary and unaudited. Note the close similarity between several figures across quarters and product lines; readers extracting a single number should double-check which row and column it came from.

Segment	Q1 2026	Q2 2026	YoY Change
Consumer (RX-20/RX-200)	\$4.50M	\$4.05M	+3.1%
Industrial (RX-2000 series)	\$45.0M	\$40.5M	−4.8%
Service & Support	\$4.05M	\$4.50M	+9.7%
Total	\$53.55M	\$49.05M	−3.9%

6. Safety Notice — Emergency Shutoff Sequence Change

Effective immediately, the emergency shutoff sequence for all RX-series industrial units has changed from the previously documented combination to Ctrl+Alt+Shift+E. This change was made after a firmware update remapped the legacy key combination to a diagnostic mode on units running controller firmware 4.2 and above. Facilities must update the placard next to every installed unit per safety policy SP-114 and confirm the new sequence with all certified technicians before their next shift. Units still running firmware below 4.2 continue to use the original sequence documented in the January handbook until they are updated.

This is a safety-critical change. Regional support leads should confirm read receipt from every certified technician within five business days of this addendum's effective date.
